

Dear Talent Acquisition Team

I am Gama

A PhD in Neuroscience who became passionate about the relationship between human and man-made brains, which led me to feel interested in Computer and Data Science.

As a researcher, I developed a solid basis in developing workflows that start by organization of databases, data-driven analysis and explainable results, with visualizations and reports demonstrating the link between all those processes.

My work

I have worked on development of algorithms that programatically range from search of datapoints to modelling signals, development of neuronal networks and fine-tuning use of GPTs.

The publication of several products resulting from the positions I have held, reflect the capability of both my work and my ideas to be developed and shared through manuscripts at any level, included high-level stakeholders.

The near future

I am currently looking for remote positions, as I have also an independent work rhythm and routines that allow me to work in a structured fashion without necessarily having to attend a physical space.

Hopefully I can be considered for bringing new ideas to the team.

Kind regards
